

Wire Tracking Center - Market Research Summary & Feature Concept

Discovery draft - input to the Wire Tracking Center Business Requirements Document (BRD)

Document ID	PM-WTC-MR-0.3
Version / Status	0.3 / Draft
Document owner	Sarah Whitfield, Senior Product Manager - Wire Tracking
Approver(s)	Marcus Chen (Director, Digital Treasury Product) - pending
Effective / Last reviewed	2026-10-06
Classification	INTERNAL - DRAFT

1. Problem and opportunity

Corporate clients cannot see where their wires are after release. They call Treasury Support, email relationship managers, and delay downstream actions (shipping goods, releasing payroll) until they get confirmation from counterparties.

Signal	Data (trailing 12 months)
Wire-related inquiries to Commercial Service Center	61,000
Share that are 'where is my wire' (WISMO)	38% (~23,200 calls)
Average handling time, WISMO	11.5 minutes (~4,440 agent hours / year)
Calls about held / pending wires	~9,800
Top NPS detractor theme, Treasury Management	'No visibility after I send a wire' (31% of detractor comments)

2. Client research (24 interviews, Aug-Sep 2026)

- 14 mid-market and 10 large corporate clients; roles: treasury administrators, AP leads, controllers.
- Top needs: (1) know the wire has left the bank and reached the beneficiary's bank; (2) proof for counterparties; (3) international visibility including intermediary fees; (4) understand and resolve held wires quickly; (5) expected timing based on past experience.
- Quote: 'FedEx tells me where my \$30 package is. My bank can't tell me where my \$400,000 wire is.'

3. Competitive scan

- Several Tier-1 US banks offer Swift gpi-based tracking in portals and APIs (for example J.P. Morgan's Payment Status Track-n-Trace with GPI).
- Leaders show intermediary route, deducted charges and a 'credited' confirmation for international wires.
- Few peers offer self-service actions on held wires - an opportunity to differentiate.

4. Feature concept (v0.3)

ID	Capability	Concept detail
FC-01	FedEx-style domestic timeline	Wire Submitted -> Wire Approved -> Bank Received -> Confirmation Number Generated -> Settled . 'Settled' can be shown when the CBO status shows 'Completed' (already available today).
FC-02	International live route (Swift gpi)	Live map of intermediaries refreshed every minute; ' Expected delivery: Today ' on every gpi wire; intermediary and beneficiary fees; 'Delivered' when funds reach the beneficiary bank.
FC-03	Held wire review & self-service	Show the exact review reason from the risk system so clients understand (e.g., 'Potential duplicate', 'Unusual activity detected', 'Sanctions screening in progress'). Confirm / Reject buttons on all held wires . 'Risk & Release insights: this wire will be released about 30 minutes after you confirm.'
FC-04	Wire Insights	' Beneficiary typically moves funds within 4 hours. ' '92% of similar [currency] wires complete the same day.' ' Predicted delivery time ' for this wire based on the client's similar past wires.

ID	Capability	Concept detail
FC-05	Notifications	'Notify me when this wire settles' per wire; category alerts (released, settled, returned, international milestones).
FC-06	Share status with recipient	One-click live tracking link for the beneficiary including full wire details, fees and funding account.
FC-07	Returned wires	Return reason, root-cause insight and one-click resend.

5. Assumptions and dependencies (PM view)

- Status data comes from the Payments Hub status API that Wire Center already uses.
- gpi data: Payment Networks Engineering (Raj Malhotra) - see spike CBO-4480.
- Insights can be calculated in the CBO wire BFF from wire history.
- Notifications use existing ENS wire events.
- Mostly front-end work for the CBO Wire Center squad; estimate 1.5 PIs.

6. Success metrics

Metric	Target (12 months post-launch)
WISMO calls	-40%
Held-wire resolution time	-50%
Treasury Management NPS	+8 points
Wire Center weekly active users	+25%

7. Target timeline

Pilot with 30 clients in February 2027; general availability in Q1 2027 with all capabilities FC-01 to FC-07.
